CYBERSECURITY INTERNSHIP PROJECT REPORT

Week 2 | Project Module 1: Footprinting & Reconnaissance Attacks with Kali Linux

Program / Batch	B084C-Networkwalks Cybersecurity Internship	**Authorization Ref**	NW-LOA-B084C-017
Intern Name	Vanshita Choudhary	**Target System**	networkwalks.com

1. Executive Summary & Objective

This technical report documents the execution of Phase 1 (Footprinting and Reconnaissance) against the authorized target domain networkwalks.com under Letter of Authorization reference NW-LOA-B084C-017. Utilizing six native Kali Linux reconnaissance utilities (whois, whatweb, nslookup, curl, wafw00f, and dnsrecon), passive and active information gathering was performed to map the target's digital footprint, web technology stack, security controls, and DNS infrastructure.

2. Task 1: Domain Registration Details (whois)

> `Command Executed: whois networkwalks.com`

Findings: The query extracted domain registration metadata, identifying GoDaddy.com as the registrar and HostGator name servers (ns6135.hostgator.com, ns6136.hostgator.com). Note: Rate-limiting was observed during repeated queries, confirming strict public registry defenses.

```
Registrar: GoDaddy.com, LLC Registrar Abuse Contact Email: abuse@godaddy.com Name Serve
r: NS6135.HOSTGATOR.COM Name Server: NS6136.HOSTGATOR.COM Status: clientDeleteProhibite
d, clientTransferProhibited
```

3. Task 2: Web Technology Fingerprinting (whatweb)

> `Command Executed: whatweb networkwalks.com`

Findings: Identified the target operating behind an Apache web server, running WordPress CMS (v7.1.4), WordPress Download Manager (v3.3.76), Bootstrap framework (v7.1.4), jQuery (v3.7.1), and hosting infrastructure located in the United States.

```
http://networkwalks.com [301 Moved Permanently] Apache, Country [UNITED STATES] https://
networkwalks.com [200 OK] Apache, Bootstrap [7.1.4], IP [192.232.216.135], JQuery [3.7.
1], WordPress [7.1.4]
```

4. Task 3 & 4: IP Resolution & HTTP Headers (nslookup & curl)

> `Commands Executed: nslookup networkwalks.com | curl -1 https://networkwalks.com`

Findings: Resolved domain name to its hosting IP address (192.232.216.135). HTTP headers revealed server status, security policies, and exposed endpoints such as the WordPress REST API (/wp-json/).

```
Name: networkwalks.com Address: 192.232.216.135 --HTTP/2 200 link: <https://networkwalk
s.com/wp-json/>; rel="https://api.w.org/" server: Apache
```

5. Task 5: Web Application Firewall Detection (wafw00f)

> Command Executed: wafw00f networkwalks.com

Findings: Detected active defensive measures protecting the application layer. The target is deployed behind a ModSecurity (SpiderLabs) Web Application Firewall.

```
[+] Checking https://networkwalks.com [+] The site https://networkwalks.com is behind Mo
dSecurity (SpiderLabs) WAF. [-] Number of requests: 2
```

6. Task 6: Comprehensive DNS Enumeration (dnsrecon)

> Command Executed: dnsrecon -d networkwalks.com

Findings: Enumerated complete DNS architecture including Start of Authority (SOA), Mail Exchange (MX), Text (TXT/SPF records for email authentication), and cPanel service (SRV) records.

```
[*] NS: ns6135.hostgator.com (50.87.144.87) Bind Version 9.16.23-RH [*] MX: mail.network
walks.com (192.232.216.135) [*] TXT: v=spf1 +a+mx +1p4:50.87.144.87 +include:websitewelc
ome.com -all [*] Enumerating SRV Records: cPanel mail discovery records found.
```

7. Conclusion & Security Implications

The footprinting phase successfully mapped the target infrastructure without triggering alerts. Discovered software versions (WordPress 7.1.4) and security controls (ModSecurity WAF) provide vital intelligence for planning authorized vulnerability assessment in subsequent internship modules. All activities strictly adhered to the authorized scope.
